

Beyond and Above the Algorithmic Perpetration of Human Life

What is mostly to be feared today is not the actual problems with which media confront us but rather the increasing incapability to act and think. Contemporary humanity is increasingly locked within given parameters, binary values which cannot be nuanced.

We are in other words living under a given algorithm which is established in its operational function around the globe, assigning to nations and social classes different roles yet maintaining basic characteristics. Under these conditions it becomes impossible for any human but even for any other creature to act and think in a different manner. You either act and think as the algorithm or you are out and therefore you are bad.

This algorithmic existence under which we are asked to vegetate cannot be create, as I just specified another pole of opposition. This pole of opposition is counter algorithmic and denies and destroys all that the algorithm enables. These macro tendencies that are clearly distributed in time and space over the brief course of modern history had and will have catastrophic consequences.

Above all, presently, what is to be discovered is the level of conservativity masking even the most progressive looking folk. While we clearly point our fingers at the hegemonic leaders of the counter algorithm it is important to discover among us the perpetrators of a too rigid and dogmatic way of conceiving humanity and the future of it. Many an individual now come to my mind who have been brainwashed and are brainwashing.

Brainwashing thus occur on each side of our algorithmic and counter algorithmic humanity. Most importantly is therefore not to be right nor left but to be and in order to be one ought to individually undertake a journey, a struggle and effort of being born out of the mediated cave. Only this effort out and away from the all the algorithmic dictum can give birth to a being with a high level of common sense and justice. The mannerism in which the sons of those who have established the algorithms it is what is most dangerous I believe.
