

WALKS 05/12 Generally I easily remember my movements in well known environments and can reconstruct with my own head a cartography of the places I explore. Over the years I have also become quite skilled in reproducing manually the hand drawing I make of my movements. For the reproduction I use an old fashion computer mouse and select two points in space to either make a straight line or a curve. Often also I make use of a cutting tool to break the lines I make so as to delete a part of them. I also make use of a feature aligning the starting or ending point of a new line with the starting or ending point of an old line. Following are the parameters that I use to render by hand my walks. To do so I use LayOut, a now obsolete software freely distributed by Google up to 2009. Here the document is set to 52 by 52 centimeters, and the margins 1 centimeter. The stroke of the actual line I use to retrace my walks is set to 1 point and the fill feature is unchecked. After a panel of month of walks is completed, I export it to .pdf format in the highest quality and making sure to uncheck the layers button so as to superimpose the drawings of previous month files. (Fig. Picture of my usual morning set up to retrace the walks I have first traced on paper. I could easily just copy and paste certain patterns I drew in older month files but every month perfect them by drawing them from scratch).
